mimix mimi Discuz! Site Recherche mimi discuz mimi "No, no," he said. "I do not think that your mother would do that. In a small town on the French Riviera, the young child Mimi watches as her mother tries to commit suicide. Sensitive detection of histone H1 kinase activity in the living mouse brain. A brain tissue homogenate can be directly used to measure the kinase activity of histone H1 in vitro. However, the kinase activity in vivo can only be detected if the proteins in the brain have been first extracted with the non-ionic detergent Triton X-100. Here, we report the development of a procedure that can measure kinase activity in vivo directly from brain tissue. The assay uses histone H1 as the substrate and includes a pre-incubation period to stabilize and activate the kinase. By taking advantage of the concentration and biochemical properties of H1, the assay is not only suitable for measurements of low endogenous kinase activity, but is also ideally suited for small molecule drug screening.

1. Field of the Invention The present invention relates to an information communication terminal device, a method of controlling the information communication terminal device, and a storage medium.

2. Description of the Related Art The 3rd Generation Partnership Project (3GPP) Long Term Evolution (LTE) which is one of the next-generation cellular systems is designed to realize high-speed packet-based communication with a transmission rate of at least 100 Mbps. The LTE supports a voice service as well as the high-speed data service, and can provide a data rate of at least 20 Mbps in the downlink and at least 10 Mbps in the uplink. The LTE adopts Orthogonal Frequency Division Multiple Access (OFDMA) as a radio access method, and employs Adaptive Modulation and Coding (AMC) and channel-sensitive scheduling to achieve both high data rates and high spectral efficiency. In a wireless communication system, the power of the radio waves emitted from the communication terminal device (also referred to as the user equipment) is constrained. As a result, there is an upper limit on the maximum power that the communication terminal device can receive from the base station. The communication terminal device sends information about the power of the received signal to the base station, so that the base station can set the transmission power. The
