Dissecting aortic annular size and annular dilatation in acute type A aortic dissection: a noninvasive approach. This study sought to assess the utility of aortic annular size and aortic annular dilatation (AAD) in the diagnosis of acute type A aortic dissection (ATAAD). AAD is associated with a significant increase in the risk of death and aortic rupture in patients with ATAAD, and clinicians use it as an exclusion criterion. However, the utility of AAD in discriminating ATAAD from type B aortic dissection (TABAD) has not been investigated. From 2005 to 2007, consecutive patients with an aortic root aneurysm were enrolled and underwent transthoracic echocardiography, including measurement of the aortic annular diameter. Patients were classified as having ATAAD or TABAD. The study population included 64 patients, with 14 (22%) having ATAAD. The mean age was 51.1 ± 8.6 years, and the male:female ratio was 6:1. The size of the aortic annulus was $5.3 \pm$
