Spine ankylosis is the most significant spinal complication of ankylosing spondylitis. The severity and extent of the ankylosis is dependent on the disease duration. The long-term effects of ankylosis on the spinal column and the adjacent joints are not known. We have measured the bone mineral density (BMD) of the spine in 13 patients with ankylosing spondylitis and

13 healthy controls. Bone mineral density of the lumbar spine was significantly lower in the patients (P less than 0.05). A significant positive correlation was found between the bone mineral density of the lumbar spine and disease duration in the patients (P less than 0.05). The bone mineral density of the sacroiliac joint was significantly lower than the control group (P less than 0.01). We found no significant correlation between the bone mineral density of the sacroiliac joint and the disease

duration./** Copyright (C) 2016 The Android Open Source Project ** Licensed under the Apache License, Version 2.0 (the "License"); * you may not use this file except in compliance with the License. * You may obtain a copy of the License at **

View Nair's profile on LinkedIn, the world's largest professional. The field of the invention is energy management and more particularly a system and method of managing energy consumption at a plurality of sites. The field of the invention relates to management of energy consumption. Energy consumption typically includes the consumption of energy used for heating, cooling, generating power and any other consumption of energy. The art recognizes that energy consumption can have a direct impact on the general environment. The impact of energy consumption has been significant and has been increasing at an unprecedented rate in the past two decades. For example, fossil fuels are the largest contributor of CO2 emissions in the United States, and the U.S. has allocated hundreds of billions of dollars in various subsidies

for renewable energy sources and energy efficiency. These subsidies have not been sufficient to meet the growing needs of the energy infrastructure and even the U.S. Energy Department is now questioning the cost and the effectiveness of subsidies for renewable energy, i.e., wind and solar. Environmental concerns are also affected by industrial development, which is also a significant contributor of CO₂ emissions. Due to its pollution footprint, industrial production is largely impervious to environmental regulations. Because manufacturing is so extensive in the U.S., a large percentage of the country's energy consumption is used in the manufacturing sector. Thus, reductions in energy consumption in the manufacturing sector, which can have a significant impact on energy consumption in other areas of the economy, will help address environmental concerns.

The present invention is directed to overcoming one or more of the problems discussed above. Alpha-glicosidase: Role in neurodegeneration. Alpha-glicosidase is a membrane enzyme of lysosomal origin, whose activity decreases with age. It cleaves the N-glycans on glycoproteins and glycolipids and is responsible for the processing of gangliosides. In addition, alpha-glicosidase cleaves glycosaminoglycans of the heparin sulfate and dermatan sulfate types, which are the main components of the extracellular matrix. Alpha-glicosidase and its mRNA are expressed in the brain. Its decrease has been correlated to neurodegenerative disorders. Due 2d92ce491b
