[...] Hopefully someone can explain, what I do wrong. I'm using ircmd, but that might not matter. EDIT 2 For complete reference of my steps, please take a look at the edit history of the question. A: I found the problem: I wanted to use the unit 16.16 as a fortran-sig 8.0. My fortran compiler, gfortran, creates .f files. If you want to open the fortran-sig 8.0, you have to use the file-sig8.f (gfortran creates those). In my case the problem was, that I had to look for the .f file, because it was hidden in the fortran-sig 8.0-compiler and the "open folder" didn't see it. I hope I could help somebody. Acrocercops fredella Acrocercops fredella is a moth of the family Gracillariidae. It is known from Canada (Nunavut, Northwest Territories, Northwest Ontario, Quebec, Saskatchewan, Yukon), the United States (Pennsylvania, Colorado, Utah, Texas, Arizona) and Mexico. The larvae feed on the leaves of Alnus, Betula and Larix species. They mine the leaves of their host plant. References fredella Category:Moths of North America Isolation and kinetic characterization of the potent chymotrypsin inhibitor from the black widow spider, Latrodectus hasselti. A low-molecular-weight compound, isolated from the venom of the black widow spider, Latrodectus hasselti, has been shown to be a potent and selective inhibitor of the enzyme chymotrypsin. This substance inhibited chymotrypsin in the nano- to micromolar concentration range and was stable under conditions of digestion by trypsin, alpha-chymotrypsin, and subtilisin. The compound was synthesized in small quantities by automated Edman degradation of synthetic peptides. The nonapeptide, H-Ile-Ile-Phe-Leu-Val-Leu-Phe-Thr-Val-Ala-Phe-Thr-Leu-OH, was synthesized in 47% yield. The inhibition was 2092ce491b
