A: There is the A20GT90X-VM4F4 board that has the TV4 firmware and 128MB RAM but has a Cortex-A7 Package Contents GT90X TV4 Serial no. BT-i20 QI Dongle manual support Also this computer is very old - It was meant to be a 2011 model. You can get it on Amazon - or purchase it directly from me. Note this is not a product sold by OPower. Entropy-driven fuel cell reformers are known in the prior art. In these known prior art devices, the primary heat source is a burner which heats and vaporizes fuel by burning a gaseous fuel in air in a combustion chamber. The heated air then passes through a duct and into a reformer. The reformer is the area of the fuel cell where the fuel gas is converted to a hydrogen-rich gas stream which is then supplied to the fuel cell. The burner, and any other heat sources which may be used with the reformer, is sized to provide sufficient heat to support the reformer process. This process can be used to provide hot air to the furnace. In all known prior art, the reformer is in thermal contact with the burner combustion chamber. As a result, fuel gas that is heated by the burner and reformer in a known prior art is heated by direct contact with the burner in the burner combustion chamber. This can lead to the oxidation of the reformer and combustion chamber. As a result of this oxidation process, the burner and/or the reformer can be damaged. As mentioned above, the known prior art reformers are provided with a burner which is in thermal contact with the reformer. The burner is provided to vaporize fuel gas to generate a hot hydrogen rich gas stream for the fuel cell. This known prior art reformer typically includes a burner chamber which encloses and is in thermal contact with the reformer. The combustion chamber provides a fuel gas outlet for the burner and a fuel gas inlet for the fuel reformer. The burner and reformer are located in thermal contact within the burner chamber. In known prior art, the burner can be used to provide a controlled flame which can be used to heat the reformer. The hot hydrogen gas stream can be used to heat the reformer and the combustion chamber. As noted above, the burner 2d92ce491b
