DDFileCatcher is a desktop utility designed to keep track of all the file metadata you may need. Being capable of identifying up to 700 Windows file properties, it can save to your PC the information you may require. It is an intuitive piece of software that makes the process of extracting and saving metadata as easy as pie. It offers you a very complete list of properties from which you can choose the ones you need to investigate and save them to your PC. With the optional option, it can show you example properties for all items in the file list or strictly the selected ones. And when you're done, it will offer you an easy way to save the file properties to your PC. The last tab of the main window gives you the chance to customize the way in which the information is formatted. You can either display all properties on one line or you can add a new line for each property. You can also specify whether you want the program to show you example properties for all the items in the file list or strictly the selected ones. Another feature you can enable is the option to export the file properties to a comma-separated values file. The end result is a fairly extensive metadata report that lets you explore and save all the file properties you may need. IDLE requires Python 2.7.6 or later. It does NOT include the GUI. You can download the GUI and test mode here. Python 2.7.6 or later Pip v8.1.1 or later PySpark v0.15.0 or later PyYAML v3.10 or later NumPy v1.11.0 or later R v3.2.2 or later SciPy v0.19.1 or later Scipy v0.19.0 or later

An easy-to-use tool for inspecting the metadata of your files. DDFileCatcher will analyze the metadata for your files and report back to you. It can help you to get the most from your files, by listing the metadata of your files. Software Release Date: 03/01/2014 OS Support: All inhibitory activity of epigallocatechin-3-gallate against hepatitis C virus replication. Inhibition of hepatitis C virus (HCV) replication by flavonoids, a group of phytochemicals, has been investigated in recent years. Epigallocatechin-3-gallate (EGCG), a polyphenol of green tea, has been shown to inhibit HCV replication in vitro. However, the effects of EGCG on HCV replication are not satisfactory in all assays. The objective of this study was to examine the antiviral effect of EGCG against HCV replication in Huh7 cells. In addition, we studied whether the EGCG-induced inhibition of HCV replication was due to activation of the 2-5A-dependent RNase L/p56(lck) pathway. The cytotoxic effects of EGCG on Huh7 cells were evaluated by MTT assay. The expression of HCV structural and nonstructural proteins was detected by Western blotting. The EGCG-induced activation of RNase L was confirmed by an RNase L activity assay. We found that EGCG inhibited HCV replication in a dose-dependent manner. EGCG also induced the activation of RNase L in Huh7 cells in a dose-dependent manner. However, it did not induce significant changes in the expression of HCV core and NS5A proteins. EGCG at a concentration of 100 microg/ml was the most efficient in suppressing HCV replication. Therefore, in this study, we further determined the effective inhibitory concentration (EC(50)) of EGCG and found that it was 20 microg/ml, which was much lower than the concentration (100 microg/ml) of EGCG that maximally activated the RNase L/p56(lck) pathway in Huh7 cells. We concluded that EGCG may suppress the replication of HCV via its specific mechanism of action rather than through activation of the RNase L/p56(l
