This is the sixth post in a series on AutoCAD and architectural design. In this article, you will learn about the different types of commands available to AutoCAD users. We will look at the various options and commands available to create drawing objects and edits using drawing commands and AutoCAD commands. This article focuses on commands that AutoCAD provides by default. For a complete list of all AutoCAD commands available, please refer to the AutoCAD Reference Manual. Create objects and edit drawings with commands and AutoCAD commands. When you start a drawing with the default selection of commands, you can view and edit the AutoCAD drawing objects from the command line. There are two sets of commands: a) AutoCAD drawing commands: These are graphical commands that are available when you select the Draw command (designer) button on the main toolbar or when you press the D key on the keyboard or when you press the designer button on the ribbon. The commands available in this set are: Insert, delete, select, move, rotate, scale, mirror, ornaments, text, and layers. AutoCAD options and palettes are also available when you select the Draw command (designer) button. b) Drawing commands: These are commands that do not work on the main toolbar. They are available when you press the D key or when you select the design command from the main toolbar (the designer) button. The commands available in this set are: Line, arc, and bevel. AutoCAD objects are created using a drawing command and AutoCAD commands. AutoCAD drawing commands are designed for creating 2D and 3D shapes. AutoCAD drawing commands have the following attributes: The command or command block must be selected to be used. The command or command block is shown on the command line as a menu. The command or command block can be executed by clicking on it or by pressing the space bar. The command or command block is executed when you select it. 3.5 inches wide Multi-Track Support AutoCAD 2009 introduced "multi-track" support for drawing, enabling designers to draw with multiple tools, such as a circular and a regular drill, at the same time. Multi-track support, which is supported by all products for over two years, is a significant change from the old school AutoCAD drawing approach that required that the designer only have a single pen tool active at a time. There is no limit to the number of pens used in a drawing. If a user creates many separate drawing objects in a drawing, each object can have its own set of tools. Timeline The Timeline window displays the history of changes to a drawing. The changes consist of the creation of objects, addition of annotations to objects, and edits of object properties. A Timeline is associated with a drawing. Changes are recorded in the drawing's history, making the Timeline a convenient way to keep track of the history of the drawing. A Timeline can also be used for viewing the history of a set of drawings. Errors In the following situations, an error message will appear and will not be recorded in the drawing history. There is no previous version in the drawing history. There are missing spaces between objects in the drawing. The drawing is displayed larger than it actually is. There are no objects in the drawing. Errors in the formatting of text. A coordinate value is used for more than one location in the drawing. The drawing has been modified in-place. Q: Insert date into datetime column I'm trying to insert a date into a column with datatime in SQL INSERT INTO [database].[dbo].[table] (attribute1, attribute2, attribute3, [d.entrydate]) VALUES ('xxxxx','xxxxx','xxxxx','2011-12-16') I need it to update the attribute2 with the entrydate and keep the date as datetime. When I do this I get the following error message Conversion failed when converting date and/or time from character string. Is this the correct syntax? A: If your column is type datetime you don't need to put the value in quotes: INSERT INTO [database].[dbo].[table] (attribute1, attribute2, attribute3, entrydate) VALUES ('xxxxx', 'xxxxx', 'xxxxx', '2011-12-16') Recovery of crude oil from underground reservoirs has become commonplace, and often effective use of such oil reservoirs requires that a high proportion of the total oil be recovered. The disposal of the remaining oil is also a problem, especially in light of the increased interest in and production of natural gas in recent years. Thus, while there is still a large amount of recoverable oil remaining in the U.S. and worldwide, a relatively large amount of it must be processed to remove it from the rock, where it is trapped in the pores of the rock and thus must be freed. In attempts to recover such remaining oil, numerous technologies have been used, and various devices and systems have been used to produce, separate, clean, and dispose of the oil recovered, usually in a subterranean oil field. The oil itself is sometimes burned, but sometimes is processed further before burning. Oil production methods include heating the oil to drive off impurities such as water and gases, separating

What's New in the AutoCAD?

The AutoCAD Scribble tool has also been greatly improved: Scribble is now stored in the working drawing. It uses the same pen and ruler as the regular pen tools, allowing you to view and annotate the shape of a previously created polyline. You can also create new lines and areas and annotate shapes. Support for pressure sensitive pens and styluses. You can now create realistic freehand lines and curves in the drawing. Improved support for LaTeX and TikZ math equations. When you annotate a 2D object, like a line or circle, you can use the equation tool to add a LaTeX or TikZ notation to that annotation. The equation tool also allows you to insert a link to the corresponding expression in the current context. This allows you to link to an equation outside the current drawing in the same way as any other object. Visible structures can be edited. You can now select a visible part of an object and edit it interactively, like a freehand line, arrow or circle. You can make adjustments to the position and rotation, as well as edit the fill and outline. (video: 2:00 min.) Export to Drawing: Export directly to the current drawing, or to a designated drawing location with the "Export" command. New GIS tools: Support for ESRI Shapefiles. You can now store AutoCAD shapefiles in an ESRI Shapefile format, and import and view them in AutoCAD. The .shx, .shp and .dbf files for ESRI shapefiles are supported, and all GIS tools work with them. Support for ArcGIS Online. You can view, edit, and publish to ArcGIS Online, the service provided by the ArcGIS Server for ArcGIS Desktop. See new commands in the Help system: Download release notes here.
