In this video, we will look at the different types of bearings available in the market and understand their features. Bearings can be can be roughly divided between two categories: fixed bearings and floating or rolling bearings. A fixed bearing is so named for its design: the bearing housing does not move up and down on the base, hence the name. On the other hand, in rolling bearings, the rolling elements (balls or rollers) are mounted in such a way that they can move up and down but not side to side. The characteristics of bearings are through the features such as load rating, efficiency, accuracy and stiffness. Matthias, the lead engineer on this project, had introduced in the previous video, various bearings available in the market. Thus, in this video, we have listed the pros and cons of fixed ball bearings, roller bearings, ceramic ball bearings and roller bearings. Matthias has a video listed

The MHX Classroom Helper is an Educational iPhone App created and developed by its main developer David Mourey, who is a former teacher and an Apple Certified Trainer (a.k.a. an Apple Teacher). This is an application which is designed to help teachers enhance and supplement their teaching while creating an enhanced learning experience for their students. This application is basically an iPhone App for collecting all student data and providing them with a gradebook, an email confirmation, a quick contact information, as well as other useful features. The application is also designed to be easy to use, simple to install, and very well suited for teachers who are new to the iPhone App world. What is more is that David has included in this App, 9 educational modes which are designed to assist teachers with instruction. These modes include: * Media (enhanced access to the multimedia on your iPhone) * Note taking (incorporating the use of iPhone Note Taking) * Math (keeping the math log and working with student math log) * Reading (works with iPhone reading notes) * English (works with iPhone reading notes) * Mechanics (helps to keep track of and to store student data including a student gradebook) * Test (provides a quick record to test) * Persistence (with notes database that will persist in the application for a period of time or until you delete it manually) And finally, it includes a community section where students can communicate with each other through a full functionality messaging system. The users are also given the option to create an account which will act as their forum to receive instructions from their teacher. Some of the more useful features of this application include: * Scoring a test with an optional student report * An overview of student grades by class * An overview of student grades overall * A complete Student Gradebook * A complete Teacher Gradebook * A Quick Contact Form * An Email Confirmation Form * A Complete Student Notes Database * 9 educational modes * A QR code scanner which allows a teacher to scan the QR code on a student's answer sheet and then scan the answer sheet directly from the application. * A QR code generator which allows the user to create his/her own QR code for easy integration into a student's answer sheet. * A shortcut to the main classroom helper application on the device home screen * A shortcut to the main classroom helper application on the device settings * A shortcut to the main classroom helper 80eaf3aba8

MITCalc Rolling Bearings Calculation SKF is a program for calculation of rolling bearings. MITCalc provides a simple interface for the user, so all needed information can be entered directly and directly into the calculations. MITCalc is very easy to use, including all calculations. MITCalc is an extremely fast and accurate software for calculation of rolling bearings. MITCalc program allows to work with many types of rolling bearings, such as tapered roller bearings, angular contact ball bearings, high precision ball bearings, tapered roller bearings, ball roller bearings, bushings and angular contact roller bearings. MITCalc supports bearings with different design and types of load. MITCalc helps to calculate: Bearing life. Sizing of bearings. Calculating admissible bearing speed. Calculating permissible bearing speed. Bearing speed for infinite bearing load. For angular contact ball bearings, MITCalc allows to calculate: Load distribution along the contact line of the bearing. Maximum load per contact pair. Maximum load per contact pair due to manufacturing tolerances. Maximum load per contact pair for variable load. Distribution of load between contact pairs. Contact line tolerance. Capacity factor. MITCalc can be used with any type of CAD program: IntelliCAD, Ashlar Graphite, TurboCAD, AutoCAD, and Solidworks. MITCalc is based on Microsoft Excel for calculation of rolling bearings and supports calculation of all common types of bearings. MITCalc is a program for calculation of rolling bearings of different types: Tapered roller bearings, angular contact ball bearings, high precision ball bearings, tapered roller bearings, ball roller bearings, bushings and angular contact roller bearings. MITCalc program allows to work with bearings with different design and types of load: Rolling bearing in bearing retainer. Basic loading. Low backloading. High backloading. MITCalc program provides several utilities that allow to work with these bearings: MITCalc 1.0.9.3 size charts. MITCalc 1.0.9.3 basic calculations. MITCalc 1.0.9.3 tapered roller bearing table. MITCalc 1.0.9.3 normalization of bearing life for different types of bearings. MITCalc 1.0.9.3 basic calculation of angular contact ball bearings. MITCalc 1.0.9.3 basic calculation of angular contact roller bearings. MITCalc 1.0.9.3 basic calculations. MITCalc 1.0.9.3 basic calculation of

Excel-dependant yet highly comprehensive SKF bearing calculator The first Excel-based application for bearing and seal calculations MITCalc is a simple, yet highly comprehensive tool for calculating the performance of SKF bearing and seal designs. It can compute many of the most relevant bearing and seal parameters such as the fundamental life, the service life, the percentage of original equipment manufacturer (OEM) bearings, static and dynamic safety parameter, internal leakage loss, friction coefficient, bearing speed range and lubrication oil viscosity. MITCalc is not only a powerful "life calculation" tool, but it is also able to calculate most of the other major parameters related to bearing designs. In short, MITCalc is the perfect tool for engineers and design technicians who are looking for a fast and user-friendly approach to the calculation of bearings and seals. MITCalc supports numerous popular standards for various bearing types and can be used with both 2D and 3D CAD. MITCalc is not a standalone application, however, it requires the presence of Microsoft Excel 2000, 2007, 2010, 2013 or 2016. The app is freeware.
