The name is quite self-explanatory: it's a small application to convert text into its hexadecimal equivalent. No more guesswork and time-consuming calculations required to crack a code! In the 'What's New' section, you'll find a brief description of the added features, and how to make use of them. Version 6.00 adds support for Japanese, Thai and Chinese languages. Version 5.00 introduces the "translate text" feature, which lets you effortlessly convert any text to its hexadecimal code, and the "break code" feature, which does the same but for hexadecimal characters. A prospective study of the effects of physiologic doses of inhaled histamine on airway resistance and lung volume in the lung. Histamine is released in the airways in response to a variety of stimuli and has been implicated in the pathophysiology of a number of airway diseases. Because the results of most studies investigating the effects of inhaled histamine have involved the use of pharmacologic doses, there is a need to examine the effects of physiologic levels of this agent on airway function. To determine the effects of inhaled histamine on airway function at different concentrations and for different durations, we conducted a prospective, randomized, double-blinded, placebo-controlled study in five subjects. Lung function, including specific airway conductance (sGaw), was assessed using respiratory inductive plethysmography. The subjects inhaled histamine aerosols at concentrations of 0.01 (n = 5), 0.1 (n = 4), and 1 (n = 4) and placebo (n = 5) at a flow rate of 40 L/min. After inhalation, the subjects performed voluntary hyperventilation (VHV) for 30 s at a tidal volume of 50 ml (VT = 50 ml). Tidal flow was measured by determining the time for a bolus of helium to pass through a 1-ml chamber placed in the subject's mouth. A separate control session (placebo + VHV) was administered to each subject after a washout period of 48 h. The effects of inhaled histamine on airway resistance and lung volume (Rv) were studied at 10 min, 24 h, and 48 h after each inhalation and were compared to placebo. There were no significant differences in airway conductance or Rv between placebo + VHV and histamine concentrations. However, increasing the concentration
