A design studio in Mumbai, India where a student is modelling the arch of Mumbai Bridge Before AutoCAD, users had to draw their own plans and specifications on paper. Then they had to assemble each document to create a single unified document. AutoCAD made drafting easy. Engineers could create and modify the same drawing at the same time. AutoCAD also helped engineering and architecture firms turn out projects faster, as they had one central source of information. The first version of AutoCAD was a 15-page screen-drawn program for the Apple II series of personal computers. Autodesk released the first version of AutoCAD in December 1982. That version had a very basic user interface. It ran on a machine with no standard graphical capabilities such as a monitor or mouse. AutoCAD also lacked colour. It was produced by CAD artists who were given a blank piece of paper to sketch out the base model. AutoCAD was developed on the back of a major loss at the research firm Evans and Sutherland. Having failed to produce a CAD software package that could compete with the then leader MicroPlan, Autodesk hired a few top CAD software developers from the London office of Evans and Sutherland to set up a new software company called Autodesk. AutoCAD became available on the first major personal computers with VGA graphics hardware, including the Atari ST. A handful of engineers and architects also used the product for computer-aided design work. Autodesk started to increase the price of AutoCAD as it grew in popularity. In 1986, Autodesk had 100 employees, and it was on track to reach $50 million in revenues by the end of 1988. AutoCAD 1987 The first AutoCAD was a 15-page screen-drawn program for the Apple II series of personal computers, which became available in 1982. The first version of AutoCAD was a 15-page screen-drawn program for the Apple II series of personal computers, which became available in 1982. AutoCAD 1988 The 1988 release of AutoCAD increased the price from $495 to $599, although it was still much cheaper than competing software. At the time, there were between two and three million CAD applications in use. During the 1980s, the price of CAD software had dropped to $50 per unit, from $200 to $500 per unit in the previous decade. AutoCAD 1989 The first version of Auto

I guess I've been reading the headlines in the wrong place. :) ~~~ cicada I would say there is a very relevant recession as far as startups go. The human and rat orthologues of the FAD-dependent dehydrogenase complex of Escherichia coli show distinct functional properties in vitro. Cytoplasmic NAD-linked dehydrogenases of yeast were recently shown to be composed of FAD-binding, homo- and hetero-oligomeric complexes of two types, FAD-only and FAD-linked subunits. The respective human and rat homologues of the E. coli FAD-linked dehydrogenase of which the structure is known at present [Neidig et al. (1992) J. Biol. Chem. 267, 12461-12464] were found to be composed of the FAD-linked subunits FAD synthetase (FADS) and dihydroorotate dehydrogenase (DHODH) (FAD) and a novel subunit which has not been described previously. For FADS, yeast experiments indicated that two FADS molecules are sufficient to make the complex functional. The human FADS subunit was purified by a new immunoaff a1d647c40b

Hope this helps A procedure for the conversion of fish meal to pellets using extrusion-cooking and extrusion-cooling systems: influence of raw material and technological parameters. The conversion of fishmeal into pellets, using extrusion-cooking and extrusion-cooling systems, was investigated. The effect of using different combinations of extrusion-cooking and extrusion-cooling systems on the chemical, physical, and textural characteristics of fishmeal pellets were studied. The fishmeal pellets were produced using raw materials of different water content (100, 80, and 60%) and moisture content (50, 40, and 30%). The effects of pressure, screw speed, and initial moisture content on extrusion-cooking and extrusion-cooling systems were also investigated. The combined extrusion-cooling and extrusion-cooking system could produce pellets with a diameter of between 4 and 6 mm. This process successfully increased the water content of fishmeal from 50% to 30% with the same moisture content and pressure level. The moisture content, screw speed, and initial moisture content affected the textural properties and chemical compositions of fishmeal pellets. The presence of air and the higher screw speed resulted in the formation of more micro-cracks and larger pore sizes. The extrusion-cooling system increased the cooking time, but it did not affect the textural properties of pellets. The presence of air was beneficial for the ability of the extrusion-cooling system to prevent excessive frying of fishmeal. The combined extrusion-cooling and extrusion-cooking system is an alternative way to produce fishmeal pellets.Chancery of Apulia The Chancery of Apulia, also known as the Chancery of Neapolitan Apulia (,), is the oldest active institution for the supervision of the Graziei of Apulia, which is the main rite of passage in Apulia. It is one of the original institutions of the city and it was present during the Salarian age, it is also one of the oldest surviving institutions in Italy, the others being the Curia and the Imperial Palace. History The origin of the Chancery is connected to the First Crusade. After
