And it is infinite because it does not cease, does not diminish. We cannot grasp it. We cannot be its master. All we can do is stand back and be awed. It is time for us to stand back and be awed." uTorrent is a lightweight utility that does not only make grabbing torrents easy but also packs numerous other useful features, like RSS feeds, remote access and creating your torrent files to share with others. With this document, you can gain access to a great deal of information on how to delete uTorrent from your Windows system. You can find information on the main folder in which the application is stored on your PC and where you can find the following files: A folder called U.Torrent-Setup is available in your program directory and allows you to unpack and install uTorrent. A folder called U.Torrent-Temp contains temporary files used by the application. This folder also contains a sub-folder called Settings that allows you to change the default settings for the application. If you want to remove the program from your computer, you can access this folder, click on the uninstall button and restart your system. A file named uTorrent-uninstaller is available in the Settings folder. This file can be used to uninstall the application from your PC. To uninstall the application, you can use the Add/Remove Programs tool. Alternatively, you can access the settings and un-install the program manually. As always, if the uninstall process does not work for you, you can use the following manual instructions. HOW TO REMOVE U-TORRENT Click on the Start menu button and select Run. Type cmd in the box and click OK. Copy the command below and paste it in to the cmd window. `cd C:\Program Files\utorrent\` Then, just press Enter to launch the command.
