# **GIMP** GIMP, short for GNU Image Manipulation Program, is an open source Photoshop alternative that is available for both Windows and Linux. Like Photoshop, GIMP's tasks are many and varied — image editing, web page design, and the like — and it comes with many tools. GIMP also boasts a large and vibrant online community. GIMP is a fine choice for beginning photographers. It offers many of the features found in Photoshop and Photomerge, a special blend of image editing and manipulation tools that takes a bit of getting used to. However, if you're a seasoned Photoshop user, GIMP can't give you the interactive editing features that you would find in a true Photoshop alternative. ## **Equipment** Whether you're a beginner or intermediate photographer, you'll need a few tools and a few things to store your photos. You can probably get away with the same basic equipment for most things, but your type of photography may dictate what you need. If you take a lot of pictures of people, your editing may take different approaches than if you take photographs of landscapes. Sometimes it helps to have some basic gear that you can point at something and pull the trigger. **Digital Camera** The key component in any photographic image is the camera. You may not have bought it yet, but you'll be having it for years to come. It's the most important purchase you'll make as a photographer. Get the camera you'll be comfortable with and that fits in your budget. It needs to meet the following requirements: • Provide the kind of quality that you're comfortable with • Have good ergonomics that make it easy to use • Be large enough to hold a good deal of your digital images • Have a fast processor that is capable of handling multiple images • Have a large enough memory to hold the images that you take • Have a good viewfinder with a clear image of the subject • Have the right features and controls for the type of photography that you shoot And, of course, the camera can't be too heavy. As you research camera models to buy, keep a few important criteria in

Some of the most high profile soccer players of this generation were born in the year 1991, and some of the most exciting players of the last generation were also born in the same year, 1990. That bodes well for this year's Gold Cup, which starts June 11 with an expanded field of 32 teams, 15 more than last time, including a bevy of CONCACAF powers like Mexico, Honduras, Costa Rica and Panama. It's the quarterfinals for the U.S. U-20 team, who is led by head coach Tab Ramos and several longtime veterans. But the game against Panama is the pinnacle, and if the U-20 group has learned anything from the successful World Cup team, then playing on home turf might be the tournament-changer. "In those games, they were the underdogs," says U.S. midfielder Michael Bradley, the older brother of Clint. "Now, they're going to be the favorites. They'll have the crowd behind them. That will be a big part of it. When we come into the stadium, we need to see our fans." The U.S. team is coming off a disappointing 2-2 draw in Kingston, Jamaica, that ended its hopes of reaching the final, leaving the players and coaches to continue moving forward. "It's been very successful," says U.S. defender Chris Seitz. "But you can't be satisfied. You want to win the Gold Cup. You want to win the World Cup. It's a hard pursuit, an impressive pursuit. You're talking about the worlds of soccer here." With so many veterans in the Gold Cup squad, Ramos' job is eased, and he can focus on the more essential part of managing the team, motivating his players. "We need to stay steady," Ramos said after the Jamaica game. "We need to keep our focus. We're fighting for a chance to get where we want to be. We have a long, long road in front of us." The U.S. is done for the year, with its players having returned home to college. But the future is better than the past, and the U-20 Gold Cup is a perfect way to find out just where they stand. The most successful

International diversification of generalized forms of autosomal recessive disease maps to chromosomal regions of low diversity. We examine the role of recombination in generating genetic differences between populations at the level of highly conserved autosomal regions. We first examine the conservation in the human genome of the phenotypes associated with 24 autosomal recessive (AR) disorders. We find that mutations of genes controlling these disorders occur in gene families which show extensive diversity, and by analysing the distribution of pairs of AR disorders, we find that these are mapped to specific chromosomal regions. The majority of these regions are conserved for 15-30 million years, and are therefore unlikely to be evolving under a neutral model. One of the exceptions is the region of low diversity on 2q37, which is likely to harbour a gene (most likely ARL1) which is the cause of more than one of the AR phenotypes examined, making this the most conservative region of the human genome that has any disease mutations in it. We then estimate the rate of emergence of AR mutations of these diseases during the speciation time of humans. Using these rates, we show that the majority of the diseases listed occur only in one or a few populations of humans, suggesting that these diseases and genes occurred in a single or a limited number of ancestral species. We believe that these evolutionary and genetic facts strongly support the hypothesis that mutations of the genes causing AR disorders may have emerged in ancestral species within a short time after the human-chimpanzee ancestor.// Copyright 2016 Google Inc.
