Note Everything you do in Photoshop also appears in the online help, though not necessarily in the order you may expect. For example, when you use the brush or create a gradient, you may find a long list of options explaining exactly what you've done, or you may find a single listing. The online help has different sections for each task—learning about colors, for example—and each of those sections may appear in a different order. (For example, the color section may be listed first.) When you're just beginning to learn Photoshop, this can be a bit confusing, but if you're doing multiple projects with Photoshop, you may find that the online help becomes a lifesaver. # Photoshop Elements Adobe's answer to the Photoshop crescent is Photoshop Elements. It's a lighter, simpler version of the full Photoshop, and even includes some tools that you won't find in other versions of Photoshop. Most important, it's free. Photoshop Elements includes the same tools as Photoshop, plus all the basics of traditional graphic design—colors, text, fonts, and so on—plus vector shapes, page layouts, and more. It works much the same as Photoshop, except it doesn't have a large image file size. Photoshop Elements' file size is about 10MB for both a 300dpi and a 600dpi image. This makes the transition from Photoshop relatively easy for people who want to get started with digital design, and then graduate to the more robust and

6 Essential Photoshop Elements Features In this article we'll go through the essential features of Photoshop Elements and show you how to use them. It's a good opportunity to brush up on your Photoshop skills. 1. Pixel-Based Filters and Adjustments Pixel-Based Filters and Adjustments Pixel-Based Filters Pixel-Based Filters are a fast and fun way of editing images. They help you edit colors, sharpness, contrast, lighting and more. Pixel-Based Adjustments Pixel-Based Adjustments are used for monochrome editing. Adjustments work like filters and adjust certain types of pixels in images. Pixel Magic Adjustment Tool Pixel Magic Adjustment Tool is an easy-to-use tool for monochrome adjustments. Adjustment Filters Adjustment Filters are often used in combination with a Pixel-Based Adjustment. Adjustment filters can increase or decrease Pixel-Based Adjustments. Adjustment Layer Adjustment Layers are one of the many useful Photoshop techniques. You can duplicate them to create a stack, save them and apply them to images, or even undo and re-apply them. Adjustment Brush Adjustment Brush is a powerful tool for pixel-based editing. The Adjustment Brush feature lets you edit pixels individually or by using smooth variations of colors to change an image's colors, intensity and tone. The Adjustment Brush feature is the default feature of this tool. Rounded Rectangle Tool Rounded Rectangle Tool is a perfect tool for creating rectangular, round, square, and freeform shapes. Photoshop Elements is the first version of Photoshop that introduced Pixel-Based Adjustments. Its Pixel Magic tool is an alternative to the old Photo Filter, and its Adjustment Brush is an alternative to the old Eraser. 2. Merging Layers Merging Layers Merging Layers can be an extremely useful tool. It lets you combine different parts of the same image into one. One example of this is the "merge layers to adjust colors" and "Merge Layers to Redraw" options. Merging Layers to Adjust Colors Merging Layers to Adjust Colors lets you combine two layers to adjust colors. It allows you to change specific colors or the entire image. Merging Layers 05a79cecff

Q: How to get Anticipation score for a specific column of an image file? I have a binary image file, I need to extract the prediction score of an image file for a column (say column 9), to use it in a deep learning model as its input. How can I achieve this? The following image shows what I am trying to achieve. A: There is a tool called "Imagenet_Xception_MIMIC" on github where you can check the code for the prediction of the learned model. For the specific task of this question is Line 1012 of the code 9.4k SHARES Facebook Twitter Whatsapp Pinterest Reddit Print Mail Flipboard Advertisements Americans are suffering through one of the most nonsensical, scare-mongering, fear-filled, race-baiting, and divisive presidential campaigns in a generation, yet there is one central issue that could unite us all in a common and strong cry: "Better late than never!" Once again, we are faced with the impossibility of finding concrete answers in a constantly shifting landscape of lies and half-truths, and the insanity of what this year's Republican nominee is declaring both his true views and what he will actually do once he is elected president. At last, it is apparent that the emergence of Donald Trump's many lies is not about keeping secrets – he doesn't give a damn about those – but rather the result of him being unable to hold onto one coherent lie for more than a day. Trump is a liar. It's the primary qualification for becoming president of the United States. Today's new Donald lie: "We'll see what happens." From the moment he announced his candidacy, Trump has delivered the most outlandish and reckless promises on the planet – an end to foreign wars, a three-day weekend for those who work, the closing of the borders, the banishment of Muslims, the building of an impregnable wall along the entire border with Mexico, the elimination of any and all federal employees who are not Muslim, the obliteration of the Environmental Protection Agency, the complete withdrawal of the US from the Paris Climate Accord, and on and on and on. These were simply the only promises he could make and stick to, because he can't, or won't, actually do anything. There is no way to be sure what he would

Q: Decode all UTF-8 characters which are not in range [0-127] What's the difference between these two: # encoding: utf-8 println("ö") #=> "Ã¶" # encoding: binary puts(Encoding.default_external.decode("ö") #=> "ö") #=> '%C3%B6' Put simply: I want to decode all the UTF-8 characters not listed in the range [0-127], in one operation only. The normal decode leaves an incomplete character, which looks very ugly when in utf-8, e.g.: '%CF' for ''. A: If you have an array of characters [0..127] containing the Unicode code points for non-ASCII characters in your source text, you can convert the array to UTF-8 by splitting it into chunks of length 2 to 21, converting the chunks to UTF-8, and concatenating the results. def decode_all_not_in_range[0,127] (str) str_utf8 = '' str.split("").each_char { |char| str_utf8 Murdoch think-tank calls for openness in public debate over UK Brexit Reuters Staff 2 Min Read (Reuters) - Britain's media baron Rupert Murdoch's Institute of Economic Affairs (IEA) has warned British businesses of the potential risks from leaving the European Union, but called on the British public not to shut down debate on the issue. In a new report on Brexit published on Wednesday, the think-tank said most large companies in Britain actually benefited from a membership of the European Union, despite concerns over red tape and direct trade with the bloc.
